DECLARATION

I, Mr. <name> student of Bachelor of Computer Applications, belong to School of Computer Science and Applications, REVA University, declare that this Project Report entitled “Car Rental Store” is the result of the project work done by me under the supervision of Prof. Amutha. A

I am submitting this Project Report in partial fulfillment of the requirements for the award of the degree of Bachelor of Computer Applications by the REVA University, Bangalore during the academic year 2019-2020.

I further declare that this project report or any part of it has not been submitted for award of any other Degree / Diploma of this University or any other University/ Institution.

(Signature of the candidate)

Certified that this project work submitted by <name> has been carried out under my guidance and the declaration made by the candidate is true to the best of my knowledge.

SCHOOL OF COMPUTER SCIENCE AND APPLICATIONS

CERTIFICATE

Certified that the project work entitled **Car Rental Store** carried out under my guidance by <name>, R19CA000 , a bonafide student of REVA University during the academic year 2019-2020, is submitting the project report in partial fulfillment for the award of **Bachelor of Computer Applications** during the academic year **2019-2020**. The project report has been approved as it satisfies the academic requirements in respect of Project work prescribed for the said Degree.

ACKNOWLEDGEMENT

I would like to acknowledge all whose guidance and encouragement that has made us to do what is done so far, I avail the opportunity to express our deep sense of gratitude and sincere thanks to our School of Computer Science and Applications which is always been a tremendous source for inspiration.

I express my sincere gratitude to Dr. P. Shyama Raju, Honorable Chancellor, REVA University, Bangalore for providing us the facilities.

I am thankful to Dr. Surendra Rao Shankapal, Vice Chancellor (In-charge), Dr. M. Dhanamjaya, Registrar, Dr. Yadavalli Lakshman Kumar, Pro Vice-Chancellor, Dr. Sunil Kumar S. Manvi, Dean, Faculty of Engineering and Technology, Dr. N. Ramesh, Dean, Faculty of Science and Technology, REVA University, Bangalore for their support and encouragement.

I take this opportunity to express my heartfelt sincere thanks to Dr. S. Senthil, Professor & Director School of CSA, REVA University and Prof. Lokesh , Assistant Professor, BCA Programme Coordinator, School of CSA, REVA University whose encouragement and best wishes provided impetus for this project.

My sincere gratitude to **my internal guide, Amutha . A, Assistant Professor**, for this valuable suggestion and her/his ever-following encouragement towards the completion of this project.

Last but not the least I also thank our parents for being supportive in all our activities and carrier without whom it wouldn't be possible for us to reach successful completion of this project.

ABSTRACT

Energy is one of the most essential aspect of a country's technological process. It is the primary unit, which enables every element to perform it's desired task. Saving energy is one of the main challenges in our day-to-day life.

Energy management is a subject of great importance and complexity. It is necessary to choose sources that can produce energy and reduce the involved losses. There are many technologies available to effectively monitor and save energy consumption but the Internet of Things (IoT) provides a better solution for this aspect.

The main idea here is to design an Car Rental Store where appliances like bulb and fans are controlled wirelessly based on the temperature and light intensity data. This prototype system is developed to achieve energy conservation by keeping a tab on the amount of energy consumed by each connected appliance. The system can also control the appliances.

INTRODUCTION

1.1 INTRODUCTION TO PROJECT

Description of the project:

This project is designed so as to be used by Car Rental Company specializing in renting cars to customers. It is an online system through which customers can view available cars, register, view profile and rent a car. This web application would be implementable irrespective of the location. Instead of providing products from only one rental show room the application is acting as interface between different users (borrowers and lenders). This web application is providing some additional features for vendors to edit or delete their products. Customers need to register with our site as they search and place orders in our site. We are responsible for communication between customer and the vendor and maintain the database.

Purpose:

The purpose of this project is to provide a platform for users to get rental cars in an effective and efficient manner. Online Car Store System is a one rental portal. It provides services such as Hiring Vehicles. It provides the facility to make online orders and get everything done before you reach the destination.

Aims and Objectives:

- To produce a web-based system that allow customer to register and reserve car online and for the company to effectively manage their car rental business.
- To ease customer's task whenever they need to rent a car.

Scope:

This project traverses a lot of areas ranging from business concept to computing field, and required to perform several researches to be able to achieve the project objectives. The area covers include:

- Car rental industry: This includes study on how the car rental business is being done, process involved and opportunity that exist for improvement.
- PHP Technology used for the development of the application.
- Web-platform means that the system will be available for access 24/7 except when there is a temporary server issue which is expected to be minimal.

LITRATURE SURVEY

The Rental vehicles web system is a web-based that creates by JavaScript. Our software application aims to be a complete solution for a web based car rental broker companies with the support of call center functionality in Langkawi Island It can be easy for tourist , travel agency ,and Private visitor to online make research , comparison vehicles prices and make reservation , online payment when they travel .

Problem background

The web-based that creates by administrator has many useful functions. It contains auto save data, show customer products, contact and feedback form. The web system is focuses on web-based orders, products and data binding. This system is just design for online web-based system implementation, used for administrative purpose. This system will show customers details, order details, product details, payment lists and also including online product itemized bills.

Project aim

The main mission of Rental vehicles web-based system is looking for Lankawi island rental vehicles market. It can be easy provide for tourist, travel agency, and Private visitor to online make research, comparison vehicles prices and make reservation when they travel

Project objective

In the objectives, we aim to improve the Rental vehicles business market in langkawi Island and we also consider to provide customers able to user easy way to make reservation .Example customer can use internet access to web-based system to, looking for vehicles detail or prices and so on .

- The system will save all customers details for feature references.
- Customers can save Time, save cost, get information on the web-based and can access in any time any where
- Develop for Rental Vehicles business market in Langkawi Island.

Project scope

The scope of this project is create a user friendly web-based system for customers. The web-based system must be secured and easy to manage by administrator. The following feature to be focused on my web system. In booking list, this function enables customers to see booking date when customer booking . In registration account this function enables customers to create user details and information. In vehicles model list this function enables customers to view all types of vehicles . In payment list this function enables customers to view total of pay booking list.

The important of the project

The important weakness in the current system are include, connects between web pages and layout theme or maybe more. the connection at storing data to web system loading will be slow, because the system is trying to load data files on the web-based first then only will load the contents. Sometimes it may fails and need to refresh the page again and again. Then is the layout theme, the administrator was weak in web designing. Some of the webpage tables or images maybe corrupted.

SYSTEM ANALYSIS

3.1 EXISTING SYSTEM

A car rental is a vehicle that can be used temporarily for a fee during a specified period. Getting a rental car helps people get around despite the fact they do not have access to their own personal vehicle or don't own a vehicle at all. The individual who needs a car must contact a rental car company and contract out for a vehicle. This system increases customer retention and simplifies vehicle and staff management.

3.2 PROPOSED SYSTEM

The proposed system is a web-based system which can be accessed by customer from anywhere around the world. The system can offer number of products from vendor in different locations. A vendor directly registers into this system using this system user interface without any manual approach. The proposed system can accept any type of product for rental, this system interface supports the vendors to upload their product image into the system. A customer directly interacts with this product image and gets necessary information regarding the rental products. The proposed system accepts an online request from the customers to reserve any rental system product for his own purpose. Administration plays a vital role here. Administrator can be able to communicate the reservation information of any product to that particular vendor using this system.

3.3 Module wise Description:

Registration: The User fills the registration form by giving the personal information and successfully registers with the website.

Product: After entering into vendor's homepage vendor will add his products by filling add product form, by providing sufficient details about product such as product id, available dates, rent etc and upload the image of that product.

It consists of following sub modules:

1. Update Product: Vendor can update the existing product details such as rent, available dates, etc. by entering the product id of that product.
2. Delete Product: Vendor can delete his products by entering the product id.

Searching and Booking the product: The Customer after accessing the site searches for products, if he/she finds the required product then he/she needs to fill the booking form and submit to the database.

Authentication: Authentication is nothing but providing security to the system. Here everyone must enter into the system through login page. The login page will restrict the unauthorized users. A user must provide his credential like user Id and password for log into the system. For that the system maintains data for all users. Whenever a user enters his user id and password, it checks in the database for user existence. If the user exists he can be treated as a valid user. Otherwise the request will throw back.

SYSTEM REQUIREMENTS

Hardware and Software Requirements:

Hardware requirements

Processor: Intel Pentium or More

Ram: 512 MB Ram

Hard Disk: PC with 20GB

Software requirements:

- Operating System Server: Windows XP or later.
- Database Server: MY SQL.
- Tools: WAMP Server, Sublime Text, Web Browser.
- User Interface: HTML, CSS and JavaScript.
- Backend: PHP.

SYSTEM DESIGN

5.1.1 INPUT DESIGN

In an information system, input is the raw data that is processed to produce output. During the input design, the developers must consider the input devices such as PC, MICR, OMR, etc.

Therefore, the quality of system input determines the quality of system output. Well designed input forms and screens have following properties –

- It should serve specific purpose effectively such as storing, recording, and retrieving the information.
- It ensures proper completion with accuracy.
- It should be easy to fill and straightforward.
- It should focus on user's attention, consistency, and simplicity.
- All these objectives are obtained using the knowledge of basic design principles regarding –
 - What are the inputs needed for the system?
 - How end users respond to different elements of forms and screens.

5.1.2 OBJECTIVES FOR INPUT DESIGN

The objectives of input design are:

- To design data entry and input procedures
- To reduce input volume
- To design source documents for data capture or devise other data capture methods
- To design input data records, data entry screens, user interface screens, etc.

To use validation checks and develop effective input controls.

Data Input Methods

It is important to design appropriate data input methods to prevent errors while entering data. These methods depend on whether the data is entered by customers in forms manually and later entered by data entry operators, or data is directly entered by users on the PCs.

A system should prevent user from making mistakes by –

- Clear form design by leaving enough space for writing legibly.
- Clear instructions to fill form.
- Clear form design.
- Reducing key strokes.
- Immediate error feedback.

Some of the popular data input methods are –

- Online data input method
- Computer readable forms

Interactive data input

Input Integrity Controls

Input integrity controls include a number of methods to eliminate common input errors by end-users. They also include checks on the value of individual fields; both for format and the completeness of all inputs. Audit trails for data entry and other system operations are created using transaction logs which gives a record of all changes introduced in the database to provide security and means of recovery in case of any failure.

Output Design

The design of output is the most important task of any system. During output design, developers identify the type of outputs needed, and consider the necessary output controls and prototype report layouts.

Objectives for Output Design

The objectives of input design are –

- To develop output design that serves the intended purpose and eliminates the production of unwanted output.
- To develop the output design that meets the end users requirements.
- To deliver the appropriate quantity of output.
- To form the output in appropriate format and direct it to the right person.
- To make the output available on time for making good decisions.

Various Types of Outputs

External Outputs

Manufacturers create and design external outputs for printers. External outputs enable the system to leave the trigger actions on the part of their recipients or confirm actions to their recipients.

Some of the external outputs are designed as turnaround outputs, which are implemented as a form and re-enter the system as an input.

Internal Outputs

Internal outputs are present inside the system, and used by end-users and managers. They support the management in decision making and reporting.

There are three types of reports produced by management information –

- **Detailed Reports** – they contain present information which has almost no filtering or restriction generated to assist management planning and control.
- **Summary Reports** – they contain trends and potential problems which are categorized and summarized that are generated for managers who do not want details.
- **Exception Reports** – they contain exceptions, filtered data to some condition or standard before presenting it to the manager, as information.

Output Integrity Controls

Output integrity controls include routing codes to identify the receiving system, and verification messages to confirm successful receipt of messages that are handled by network protocol.

Printed or screen-format reports should include a date/time for report printing and the data. Multipage reports contain report title or description, and pagination. Pre-printed forms usually include a version number and effective date.

5.2 ENTITY RELATIONSHIP DIAGRAM

An entity-relationship (ER) diagram is a specialized graphic that illustrates the interrelationships between entities in a database. ER diagrams often use symbols to represent three different types of information. Boxes are commonly used to represent entities. Diamonds are normally used to represent relationships and ovals are used to represent attributes

An entity-relationship model (ERM) in software engineering is an abstract and conceptual representation of data. Entity-relationship modeling is a relational schema database modeling method, used to produce a type of conceptual schema or semantic data model of a system, often a relational database, and its requirements in a top-down fashion.

Symbols used in this E-R Diagram:

Entity: Entity is a “thing” in the real world with an independent existence. An entity may be an object with a physical existence such as person, car or employee. Entity symbol is as follows

Attribute: Attribute is a particular property that describes the entity. Attribute symbol is

Relationship: Relationship will be several implicit relationships among various entity types whenever an attribute of one entity refers to another entity type some relationship exists.

Key attributes: An entity type usually has an attribute whose values are distinct for each individual entity in the collection. Such an attribute is called key attribute. Key attribute symbol is as follows

Composite attributes:

Multivalued attributes:

TESTING

Introduction of Testing:

Testing is the process of running a system with the intention of finding errors. Testing enhances the integrity of a system by detecting deviations in design and errors in the system. Testing aims at detecting error-prone areas. This helps in the prevention of errors in a system. Testing also adds value to the product by conforming to the user requirements.

The main purpose of testing is to detect errors and error-prone areas in a system. Testing must be thorough and well-planned. A partially tested system is as bad as an untested system. And the price of an untested and under-tested system is high.

The implementation is the final and important phase. It involves user-training, system testing in order to ensure successful running of the proposed system. The user tests the system and changes are made according to their needs. The testing involves the testing of the developed system using various kinds of data. While testing, errors are noted and correctness is the mode.

Objectives of Testing:

Testing is a process of executing a program with the intent of finding errors. A Successful test case is one that uncovers an as-yet-undiscovered error. System testing is a stage of implementation, which is aimed at ensuring that the system works accurately and efficiently as per the user need, before the live operation commences. As stated before, testing is vital to the success of a system. System testing makes a logical assumption that if all parts of the system are correct, the goal will be successfully achieved. A series of tests are performed before the system is ready for the user acceptance test.

Testing Methods:

System testing is the stage of implementation. This is to check whether the system works accurately and efficiently before live operation commences. Testing is vital to the success of the system. The candidate system is subject to a variety of tests: on line response, volume, stress, recovery, security and usability tests. A series of tests are performed for the proposed system is ready for user acceptance testing.

Testing Steps are:

1. Unit Testing:

Unit testing focuses efforts on the smallest unit of software design. This is known as module testing. The modules are tested separately. The test is carried out during programming stage itself. In this step, each module is found to be working satisfactory as regards to the expected output from the module.

2. Integration Testing

Data can be lost across an interface. One module can have an adverse effect on another, sub functions, when combined, may not be linked in desired manner in major functions. Integration testing is a systematic approach for constructing the program structure, while at the same time conducting test to uncover errors associated within the interface. The objective is to take unit tested modules and builds program structure. All the modules are combined and tested as a whole.

3. Validation

At the culmination of the integration testing, Software is completely assembled as a package. Interfacing errors have been uncovered and corrected and a final series of software test begin in validation testing. Validation testing can be defined in many ways, but a simple definition is that the validation succeeds when the software functions in a manner that is expected by the customer. After validation test has been conducted, one of the three possible conditions exists.

- a) The function or performance characteristics confirm to specification and are accepted.
- b) A deviation from specification is uncovered and a deficiency lists is created.
- c) Proposed system under consideration has been tested by using validation test and found to be working satisfactory.

4. Output Testing

After performing the validation testing, the next step is output testing of the proposed system, since no system could be useful if it does not produce the required output in a specific format. The output format on the screen is found to be correct. The format was designed in the system design time according to the user needs. For the hard copy also; the output comes as per the specified requirements by the user. Hence output testing did not result in any correction for the system.

5. User Acceptance Testing

User acceptance of a system is the key factor for the success of any system. The system under consideration is tested for the user acceptance by constantly keeping in touch with the prospective system users at the time of developing and making changes whenever required.

This is done in regard to the following point:

- a) Input Screen Design
- b) Output Screen Design
- c) Format of reports and other outputs.

Security mechanisms:

This system is provided with authentication, without this user can pass. So only the legitimate users are allowed to use the application. If the legitimate users share the authentication information then the system is open to outsiders.

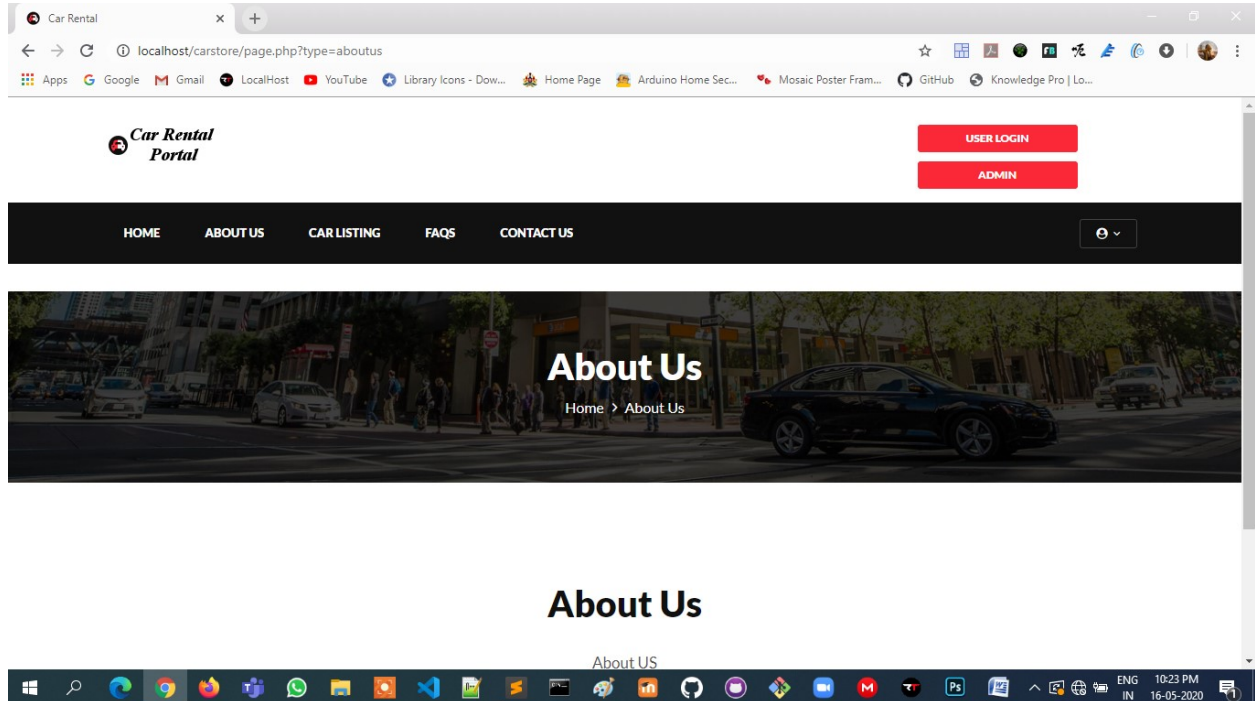

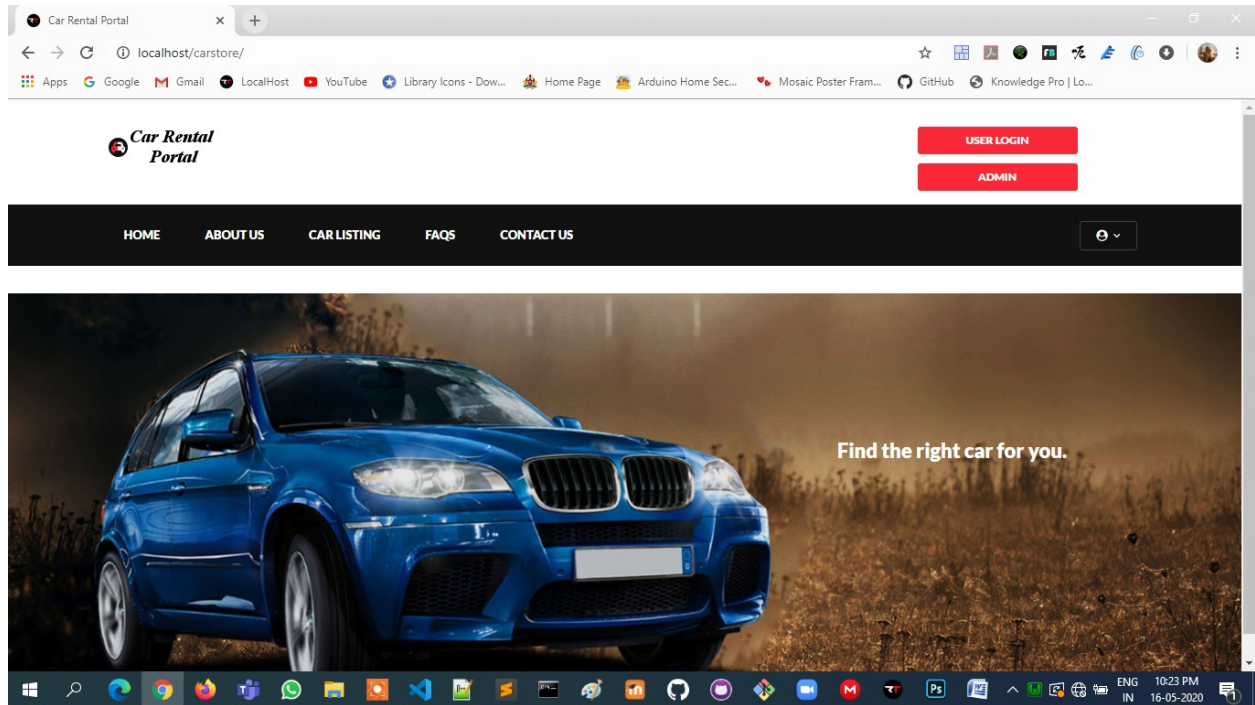

Limitations:

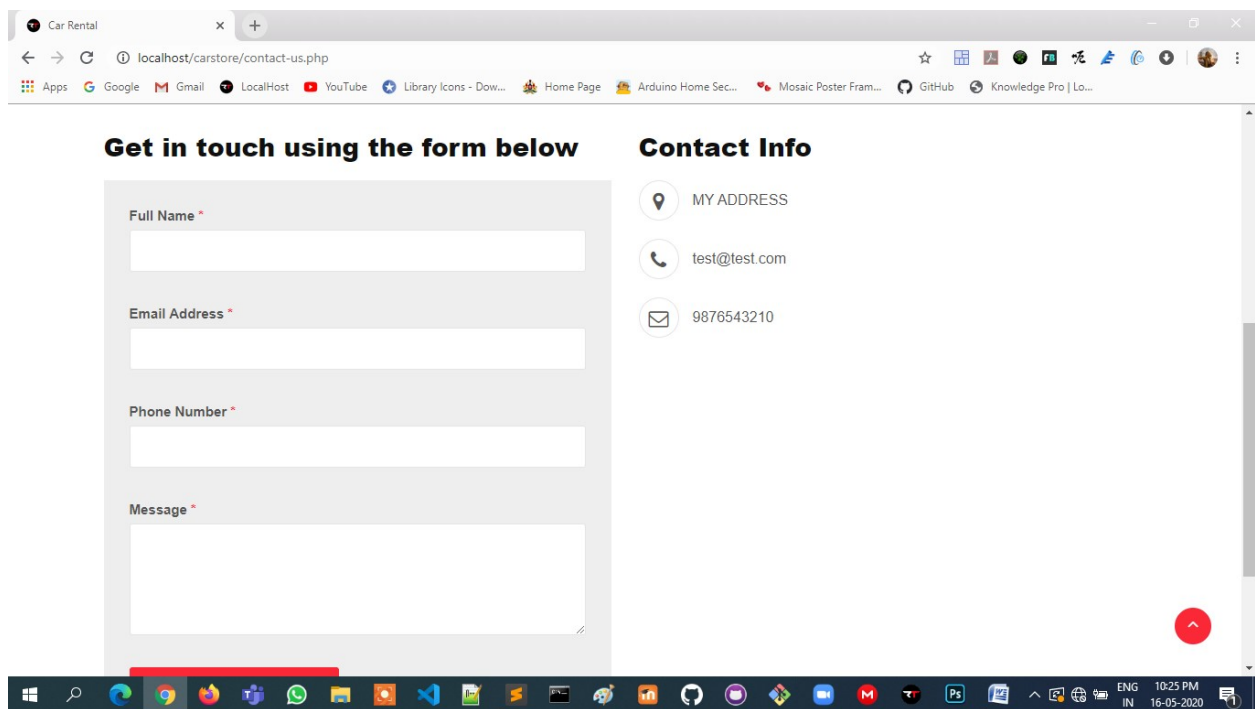

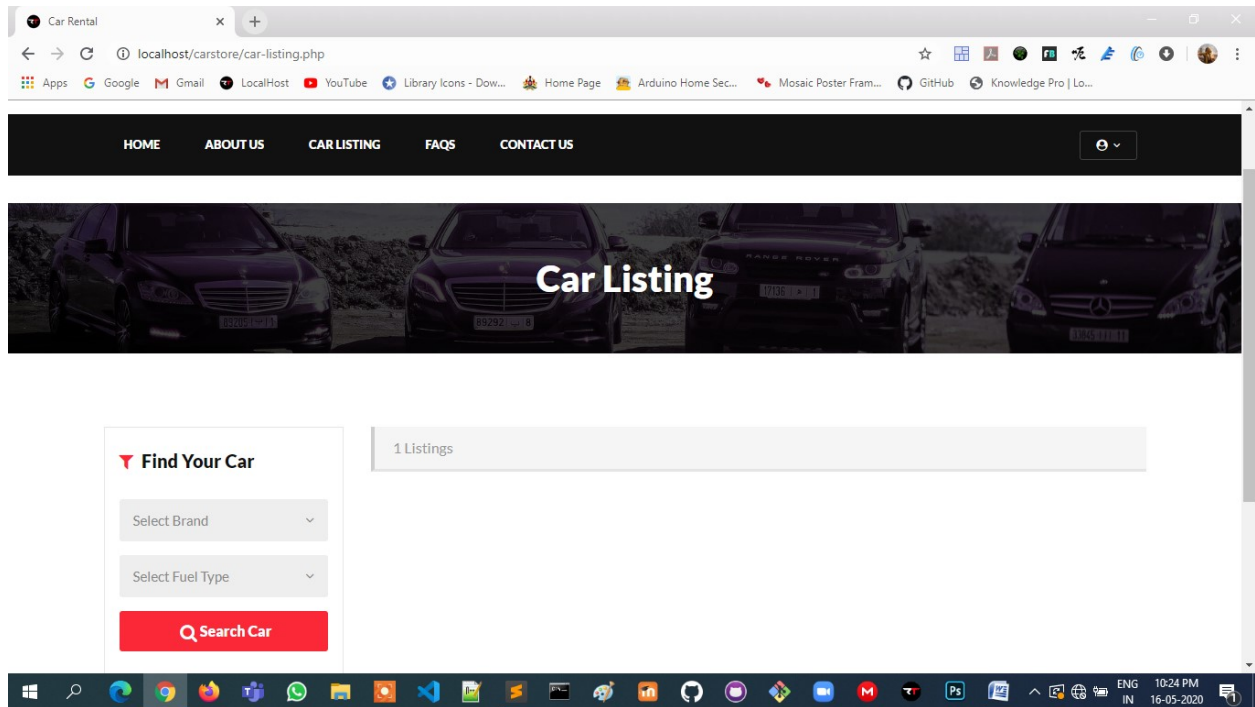

- Since it is an online project, customers need internet connection to buy products.
- People who are not familiar with computers can't use this software.
- Customer must have debit card or credit card to purchase products.

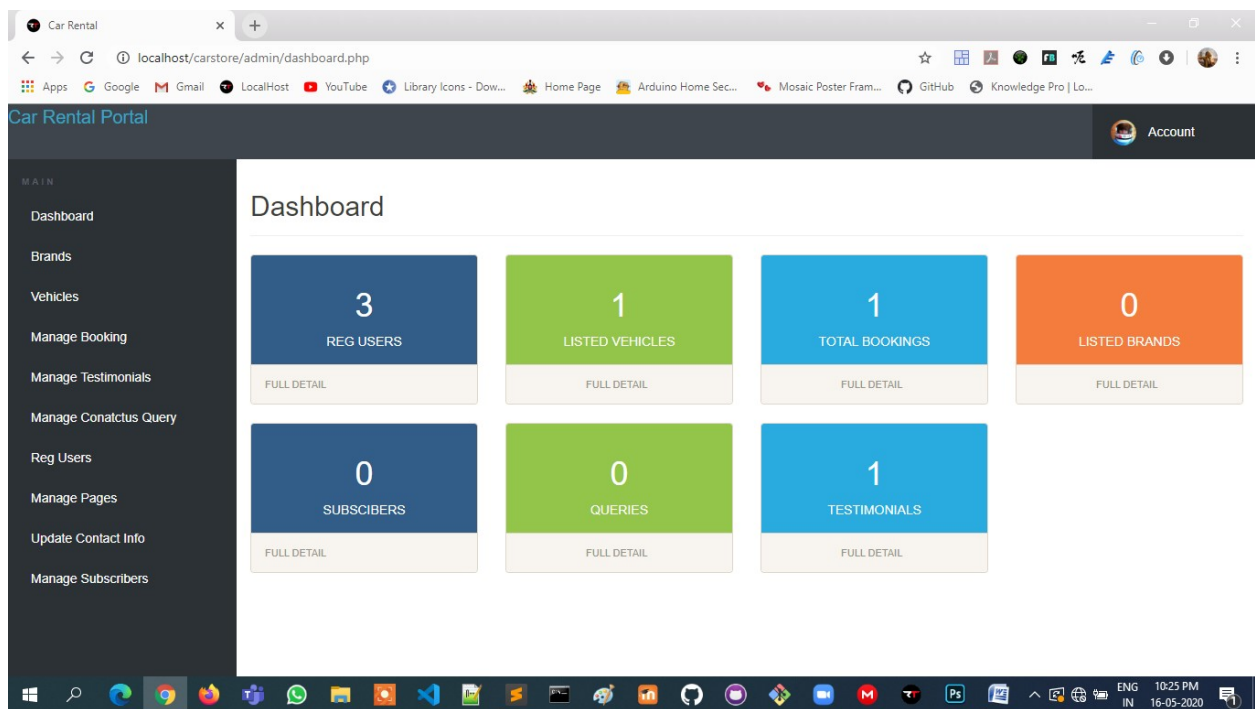

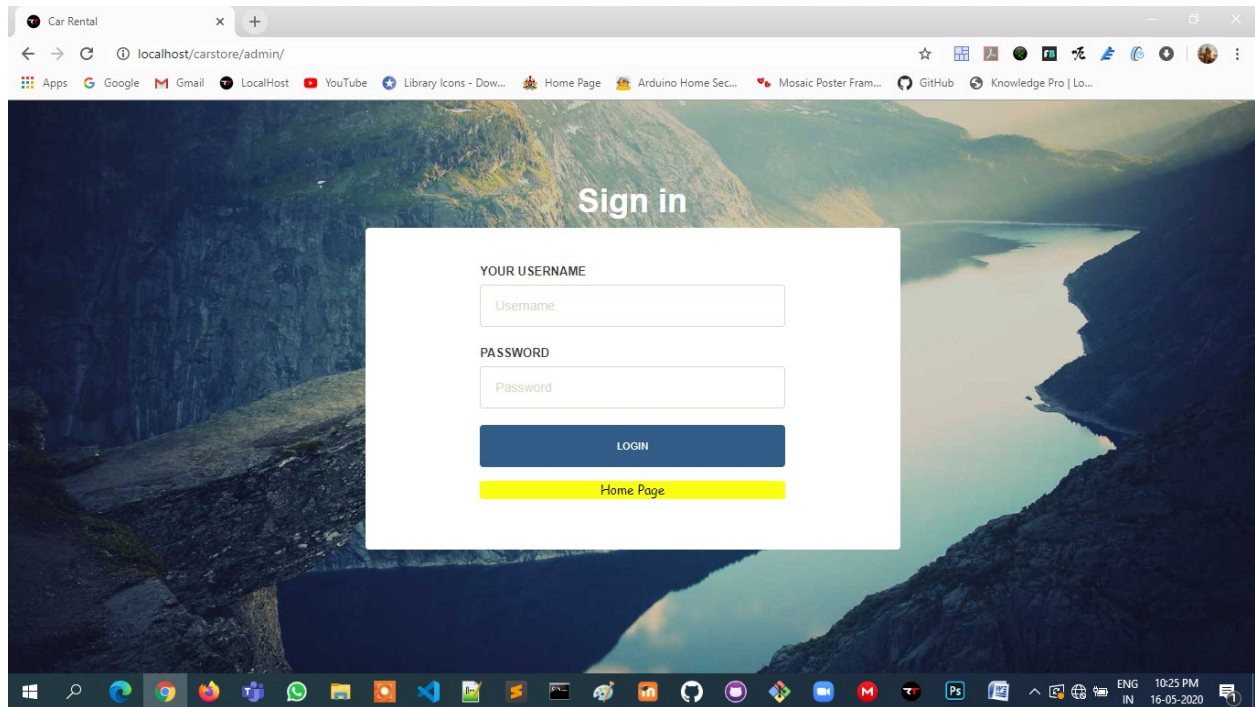

Future scope and further enhancement:

This web application involves almost all the features of the online shopping. The future implementation will be online help for the customers and chatting with website administrator

CONCLUSION

This software was developed specifically to answer to the needs of [specify]. We need to improve on and some new features to be added. Even then, this does not affect the working of this software. Some of the obvious Changes/Additions.
